## **DETAILED ACTION**

### ***Information Disclosure Statement***

The information disclosure statement submitted on September 9, 2009 has been considered by the examiner and placed of record in the application file.

### ***Examiner's Statement of Reasons for Allowance***

**Claims 1-21, 23-48, and 50-54** are allowed.

The following is an examiner's statement of reasons for allowance:

Applicant's invention is drawn to a wireless local area network control over a wired network. More specifically, applicant has designed an apparatus, which includes a switch that has a plurality of ports for connection to a wired local area network. In addition, this apparatus includes a plurality of access points that are arranged in a wireless local area network (WLAN) to communicate over the air in accordance with a predefined WLAN protocol on a common frequency channel with a mobile station using a common basic service set identification (BSSID) for all the access points, and which are coupled by the LAN to the switch so that upon receiving at one or more of the access points an uplink packet transmitted over the WLAN by the mobile station on the common frequency channel. In addition, these access points convey messages responsively to the uplink packet over the LAN to the switch. Moreover, applicant's apparatus includes a manager node that is coupled to the switch so as to receive the messages and is adapted to process the messages so as to select one of the access points to respond to the uplink packet. This manager node also is designed to send an instruction via the switch to the selected one of the access points to transmit to the mobile station a response to the uplink packet within a time limit specified by the WLAN protocol. Lastly, the manager node is connected to first and

second ports among the plurality of the ports of the switch, and is configured to receive uplink messages from the access points exclusively through the first port and to convey the uplink messages exclusively via the second port over the LAN to respective destination addresses of the message.

Applicant's independent claim 1 and 28 recites, *inter alia*, the manager node sends an instruction via the switch to the selected one of the access points to transmit to the mobile station a response to the uplink packet within a time limit specified by the WLAN protocol. As applicant has pointed out, Melpignano actually teaches away from this time limit because Melpignano discloses that a time limit for response should be intentionally allowed to expire (paragraph 19). Also, Mangold does not teach this feature as Mangold discloses that the access point transmits control frames for time sharing (paragraphs 11, 12). As the claimed invention indicates, the mobile station is transmitting the message (i.e. uplink packet). Therefore, the combination of references do not describe in detail applicant's claimed invention. As a result, the cited references and a thorough search did not disclose the operation of a plurality of access points using a manger node so that one selected access point will transmit a response to an uplink packet within a time limit specified by the WLAN protocol. In addition, it would not be obvious to one of ordinary skill in the art to invent such an apparatus and method without using impermissible hindsight and using applicant's claims and specification as a roadmap. Therefore, applicant's independent claims 1 and 28 comprise a particular combination of elements, which is neither taught nor suggested by the prior art.

Applicant's independent claim 19 and 46 recites, *inter alia*, the manager node is connected to first and second ports among the plurality of the ports of the switch, and is

configured to receive uplink messages from the access points exclusively through the first port and to convey the uplink messages exclusively via the second port over the LAN to respective destination addresses of the message. Fox teaches an MxN switch, which is comprised of a plurality of discrete devices having different addresses and is operable to connect to any of the M input ports (i.e. read as uplink, since Fox teaches a microwave system coupled to switches) and to any of the N output ports (i.e. read as downlink, since Fox teaches a microwave system coupled to switches) (column 2 lines 10-30, column 3 lines 28-42). However, Fox does not teach the configuration to receive uplink messages from the access points exclusively through the first port and to convey the uplink messages exclusively via the second port over the LAN to respective destination addresses of the message. As a result, the cited references and a thorough search did not disclose in detail applicant's claimed invention. Lastly, as with claims 1 and 28, it would not be obvious to one of ordinary skill in the art to invent such an apparatus and method without using impermissible hindsight and using applicant's claims and specification as a roadmap. Therefore, applicant's independent claims 19 and 46 comprise a particular combination of elements, which is neither taught nor suggested by the prior art.

Accordingly, applicant's invention is allowed for these reasons and the reasons by applicant in amendments, arguments, and the appeal brief.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
